

# Twisted analogue of the Kummer-Leopoldt constant

J. Assim, Z. Boughadi and A. Driwach

ABSTRACT. Let  $F$  be a number field and let  $p$  be an odd prime. Denote by  $S$  the set of  $p$ -adic and infinite places of  $F$ . We study a generalization to  $K$ -theory of the Kummer-Leopoldt constant for the  $S$ -units introduced in [7, Section 4]. We express in particular its value as the exponent of some Galois module. As an application, we give a new characterization of  $(p, i)$ -regular quadratic number fields.

## 1. Introduction

Let  $p$  be an odd prime and let  $F$  be a number field. The Kummer-Leopoldt constant [7, Definition 1]  $\kappa(F)$  is the smallest integer  $c$  satisfying the following property: if  $n$  is sufficiently large and  $u$  is a unit of  $F$  that is a  $p^{n+c}$ -th power locally at all primes dividing  $p$ , then  $u$  is a global  $p^n$ -th power. This constant exists when the couple  $(F, p)$  satisfies Leopoldt's conjecture. Given this definition, Kummer's lemma states that if  $p$  is a regular prime number and  $F$  is the  $p$ -th cyclotomic field then  $\kappa(F)$  is zero. Kummer's lemma has been generalized by several authors to  $p^n$ -th cyclotomic fields,  $n \geq 1$  [33], [32], or to totally real number fields [27]. In [33, 32, 27], the authors give an upper bound for the Kummer-Leopoldt constant in terms of special values of the associated  $p$ -adic L-function.

More generally, for an arbitrary number field  $F$ , the quantity  $p^{\kappa(F)}$  is the exponent of the Galois group  $\text{Gal}(F^{\text{BP}}/\tilde{F}L_F)$  [7, Théorème 1], where  $F^{\text{BP}}$  is the

*Key words and phrases.* Kummer-Leopoldt constant, Iwasawa module, Galois extensions,  $K$ -theory.

Bertrandias-Payan field of  $F$  [9, 25],  $\tilde{F}$  is the composite of all  $\mathbb{Z}_p$ -extensions of  $F$  and  $L_F$  is the maximal abelian unramified  $p$ -extension of  $F$ .

The Bertrandias-Payan field  $F^{\text{BP}}$  is contained in  $\widehat{F}$ , the maximal abelian pro- $p$ -extension of  $F$  which is unramified outside the  $p$ -adic primes. In particular, the Kummer-Leopoldt constant  $\kappa(F)$  is trivial if  $\widehat{F} = \tilde{F}$ . Number fields with  $\widehat{F} = \tilde{F}$  and satisfying Leopoldt's conjecture are called  $p$ -rational fields [20]. Obviously,  $\kappa(F)$  is trivial if the field  $F$  is  $p$ -rational. This can be considered as a generalization of Kummer's lemma since the field  $\mathbb{Q}(\mu_p)$  is  $p$ -rational precisely when  $p$  is regular,  $\mu_p$  being the group of  $p$ -th roots of unity.

Let  $S$  be the set of  $p$ -adic and infinite places of  $F$  and let  $U$  be the group of  $S$ -units of  $F$ . In [7, Section 4], the authors define also a Kummer-Leopoldt constant for the  $S$ -units as the smallest integer  $c$  having the following property:

$$\forall n \gg 0, \forall u \in U, (u \in F_v^{p^{c+n}}, \forall v \mid p) \implies u \in U^{p^n},$$

where for  $v \mid p$ ,  $F_v$  is the completion of  $F$  at  $v$ .

Denote by  $\widehat{U}$  and  $\widehat{F}_v$ , respectively, the pro- $p$ -completion of  $U$  and  $F_v$ . Let  $G_S(F)$  be the Galois group over  $F$  of the maximal algebraic extension which is unramified outside  $S$ . Then

$$\widehat{U} \cong H^1(G_S(F), \mathbb{Z}_p(1)) \quad \text{and} \quad \widehat{F}_v \cong H^1(F_v, \mathbb{Z}_p(1)).$$

For an integer  $i$ , we have a natural localization map

$$\begin{aligned} \alpha^{(i)} = \bigoplus_{v \mid p} \alpha_v^{(i)} : H^1(G_S(F), \mathbb{Z}_p(i)) &\longrightarrow \bigoplus_{v \mid p} H^1(F_v, \mathbb{Z}_p(i)) \\ x &\longmapsto (\alpha_v^{(i)}(x))_v \end{aligned}$$

where, for each prime  $v$  above  $p$ ,  $\alpha_v^{(i)} : H^1(G_S(F), \mathbb{Z}_p(i)) \longrightarrow H^1(F_v, \mathbb{Z}_p(i))$  is the restriction homomorphism. For simplicity, if  $x \in H^1(G_S(F), \mathbb{Z}_p(i))$ , we keep the notation  $x := \alpha_v^{(i)}(x) \in H^1(F_v, \mathbb{Z}_p(i))$ . Then, we ask the following natural question: *Is there a positive integer  $c_i$  such that for all  $n \gg 0$ ,  $x \in H^1(G_S(F), \mathbb{Z}_p(i))$*

$$(x \in H^1(F_v, \mathbb{Z}_p(i))^{p^{c_i+n}}, \forall v \mid p) \implies x \in H^1(G_S(F), \mathbb{Z}_p(i))^{p^n}?$$

In this article, we show that such an integer exists when the field  $F$  satisfies a twisted Leopoldt's conjecture (Conjecture 2.1), and we define the twisted analogue of the Kummer-Leopoldt constant  $\kappa_i(F)$  to be the smallest value of  $c_i$  satisfying this property. The study of the twisted Kummer-Leopoldt constant leads us to define some Galois extensions, in particular we construct a twisted analogue of the Bertrandias-Payan field and an étale analogue of the Hilbert class field (see §2). Using these definitions we express the twisted Kummer-Leopoldt constant as the exponent of a certain Galois group inside the twisted Bertrandias-Payan module (Theorem 3.8).

By the Quillen-Lichtenbaum conjecture, which is now a theorem thanks to the work of Voevodsky and Rost on the Bloch-Kato conjecture, the  $p$ -adic cohomology group  $H^1(G_S(F), \mathbb{Z}_p(i))$  is isomorphic to the pro- $p$ -completion of the

$K$ -theory group  $K_{2i-1}F$  [17, Theorem 5.6.8]. Hence for  $i \geq 2$ , the constant  $\kappa_i(F)$  can be considered as a generalization to  $K$ -theory of the Kummer-Leopoldt constant.

In the last section of this paper, we study the vanishing of the twisted Kummer-Leopoldt constant. We show, in particular, that  $\kappa_{1-i}(F) = 0$  if  $F$  is a  $(p, i)$ -regular number field in the sense of [2]. Furthermore, we give a new characterization of  $(p, i)$ -regular number fields in terms of the triviality of  $\kappa_{1-i}(F)$ . More precisely, we prove the following theorem:

**Theorem.** *Let  $i \neq 0, 1$  be an integer and let  $F$  be a number field satisfying the twisted Leopoldt's conjecture. Then  $F$  is  $(p, i)$ -regular if and only if the following three conditions hold:*

1.  $\kappa_{1-i}(F) = 0$ ;
2. The natural injective map

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \longrightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$$

is an isomorphism;

3.  $H^{(i)} \subset \tilde{F}^{(i)}$ , where the fields  $\tilde{F}^{(i)}$  and  $H^{(i)}$  are defined in Definitions 2.5 and 2.9, respectively.

As an application we get a characterization of  $(p, i)$ -regular quadratic number fields in the spirit of [12, §4.1], (see Propositions 4.6 and 4.7 below).

**Notation:** For a number field  $F$ , and an odd prime number  $p$ , we adopt the following notation throughout this paper:

$O_F$	the ring of integers of $F$ ;
$\mu_p$	the group of $p$ -th roots of the unity;
$E$	the composite of $F$ and the $p$ -th cyclotomic field i.e., $E = F(\mu_p)$ ;
$S$	the set of $p$ -adic and infinite places;
$U$	the group of $S$ -units in $F$ ;
$\hat{U}$	the pro- $p$ -completion of $U$ ;
$F_v$	the completion of $F$ at a prime $v$ of $F$ ;
$U_v$	the group of local units of $F$ at a prime $v$ of $F$ ;
$\hat{F}_v$	the pro- $p$ -completion of $F_v$ ;
$F_\infty$	the cyclotomic $\mathbb{Z}_p$ -extension of $F$ ;
$\Gamma$	the Galois group $\text{Gal}(F_\infty/F)$ ;
$F_n$	the unique subfield of $F_\infty$ such that $[F_n : F] = p^n$ ;
$\Gamma_n$	the Galois group $\text{Gal}(F_\infty/F_n)$ ;
$\Lambda = \mathbb{Z}_p[[\Gamma]]$	the Iwasawa algebra associated to $\Gamma$ ;
$E_\infty$	the cyclotomic $\mathbb{Z}_p$ -extension of $E$ ;
$G_\infty$	the Galois group $\text{Gal}(E_\infty/F)$ ;
$F_S$	the maximal algebraic extension of $F$ which is unramified outside $S$ ;
$\hat{F}$	the maximal abelian pro- $p$ -extension of $F$ which is

	unramified outside $S$ ;
$E_\infty^{ab}$	the maximal abelian pro- $p$ -extension of $E_\infty$ which is unramified outside $S$ ;
$L'_\infty$	the maximal abelian unramified pro- $p$ -extension of $E_\infty$ which splits completely at $p$ -adic primes of $E_\infty$ ;
$X'_\infty$	the Galois group $\text{Gal}(L'_\infty/E_\infty)$ ;
$G_S(K)$	the Galois group $\text{Gal}(F_S/K)$ , for an arbitrary field $K$ inside $F_S/F$ ;
$M(i)$	the $i$ -th Tate twist of a $G_S(F)$ -module $M$ ( $i \in \mathbb{Z}$ );
$M[p^n]$	the kernel of the multiplication by $p^n$ ;
$M/p^n$	the co-kernel of the multiplication by $p^n$ ;
$H^n(G_S(F), M)$	the $n$ -th continuous cohomology group of $G_S(F)$ with coefficients in $M$ ;
$\text{III}^n(G_S(F), M)$	the localization kernel $\ker(H^n(G_S(F), M) \rightarrow \bigoplus_{v \in S} H^n(F_v, M))$ ;
$M^\vee$	$= \text{Hom}(M, \mathbb{Q}_p/\mathbb{Z}_p)$ , the Pontryagin dual of $M$ ;

For a group  $G$  and a commutative ring  $R$ , let  $I_G$  be the augmentation ideal of the group ring  $R[G]$ ; it is the ideal generated by  $\{\sigma - 1, \sigma \in G\}$ . Unless otherwise stated,  $R = \mathbb{Z}_p$ .

## 2. On certain Galois extensions

Let  $F$  be a number field and let  $p$  be an odd prime number. We denote by  $F_S$  the maximal algebraic extension of  $F$  which is unramified outside the set  $S$  of  $p$ -adic and infinite places of  $F$ . For a subfield  $K$  of  $F_S$  containing  $F$ , we denote by  $G_S(K)$  the Galois group  $\text{Gal}(F_S/K)$ . The  $p$ -ramified Iwasawa module  $\mathcal{X}_K$  is the Galois group over  $K$  of the maximal abelian pro- $p$ -extension which is unramified outside  $S$ . In terms of homology groups, we have  $\mathcal{X}_K \simeq H_1(G_S(K), \mathbb{Z}_p)$ . Indeed, using the cohomology-homology duality, we have:

$$\begin{aligned} H_1(G_S(K), \mathbb{Z}_p) &\simeq H^1(G_S(K), \mathbb{Q}_p/\mathbb{Z}_p)^\vee \\ &\simeq \text{Hom}(G_S(K), \mathbb{Q}_p/\mathbb{Z}_p)^\vee \\ &\simeq \mathcal{X}_K. \end{aligned}$$

For an integer  $i$ , denote by  $\mathcal{X}_K^{(i)}$  the first homology group  $H_1(G_S(K), \mathbb{Z}_p(-i))$  which can then be considered as a twisted analogue of the  $p$ -ramified Iwasawa module  $\mathcal{X}_K$ . The module  $\mathcal{X}_K^{(i)}$  has been studied by several authors in the case where  $K$  is a multiple  $\mathbb{Z}_p$ -extension of  $F$ . For example, [14, 11] for  $i = 0$  and [4] for  $i \neq 0$ . Returning to the case  $K = F$ , the  $\mathbb{Z}_p$ -rank of the  $p$ -ramified Iwasawa module  $\mathcal{X}_F$  is conjecturally equal to  $r_2 + 1$ , where  $r_2$  is the number of complex places of  $F$  (Leopoldt's conjecture). There are many equivalent formulations of this conjecture. In terms of cohomology, it is equivalent to the triviality of the second cohomology group  $H^2(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p)$  (e.g., [24, Proposition 12]). More generally, we have the following conjecture (Greenberg [10], Schneider [28], ...)

**Conjecture 2.1** ( $C^{(i)}$ ). *Let  $F$  be a number field. Then for every integer  $i \neq 1$ , the second cohomology group  $H^2(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i))$  is trivial.*

Conjecture  $C^{(0)}$  is the Leopoldt’s conjecture, it holds for all  $F$  that are abelian over  $\mathbb{Q}$  or over an imaginary quadratic number field. If  $i \geq 2$ , Conjecture  $C^{(i)}$  holds for any number field  $F$ , as a consequence of the finiteness of the  $K$ -theory groups  $K_{2i-2}O_F$  [30]. By a well known result on Brauer groups [13] or [28, §4, Lemma 2], there is no Conjecture  $C^{(1)}$ .

In the next proposition we give two equivalent formulations of the Conjecture  $C^{(i)}$  that we will use in the sequel. These formulations are well known, we add here a proof for the reader’s convenience.

**Proposition 2.2.** *Let  $F$  be a number field and let  $i \neq 1$  be an integer. The following assertions are equivalent:*

- 1) *Conjecture  $C^{(i)}$  holds for  $F$ ;*
- 2) *the  $p$ -adic cohomology group  $H^2(G_S(F), \mathbb{Z}_p(i))$  is finite;*
- 3) *the Galois module  $X'_\infty(i-1)_{G_\infty}$  is finite.*

**Proof.** For  $k \geq 1$ , the exact sequence

$$0 \longrightarrow \mathbb{Z}_p(i) \xrightarrow{p^k} \mathbb{Z}_p(i) \longrightarrow \mathbb{Z}/p^k(i) \longrightarrow 0$$

induces in cohomology the exact sequence

$$H^n(G_S(F), \mathbb{Z}_p(i))/p^k \hookrightarrow H^n(G_S(F), \mathbb{Z}/p^k(i)) \twoheadrightarrow H^{n+1}(G_S(F), \mathbb{Z}_p(i))[p^k]$$

Passing to the direct limit on  $k$ , we obtain the exact sequence [23, (4.3.4.1)]

$$\begin{array}{c}
 0 \longrightarrow H^n(G_S(F), \mathbb{Z}_p(i)) \otimes \mathbb{Q}_p/\mathbb{Z}_p \longrightarrow H^n(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i)) \longrightarrow \\
 \hspace{10em} \curvearrowright \\
 \longrightarrow \text{tor}_{\mathbb{Z}_p} H^{n+1}(G_S(F), \mathbb{Z}_p(i)) \longrightarrow 0.
 \end{array}
 \tag{1}$$

In fact, by [31, Proposition 2.3],  $H^n(G_S(F), \mathbb{Z}_p(i)) \otimes \mathbb{Q}_p/\mathbb{Z}_p$  is the maximal divisible subgroup of  $H^n(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i))$ .

Since the cohomological dimension  $\text{cd}(G_S(F)) \leq 2$ , we have an isomorphism

$$H^2(G_S(F), \mathbb{Z}_p(i)) \otimes \mathbb{Q}_p/\mathbb{Z}_p \simeq H^2(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i)) \tag{2}$$

Since the  $\mathbb{Z}_p$ -module  $H^2(G_S(F), \mathbb{Z}_p(i))$  is finitely generated (see [23, Proposition 4.2.3]), the equivalence between 1) and 2) follows from the isomorphism (2).

Observe that if  $i \neq 1$ ,  $H^2(G_S(F), \mathbb{Z}_p(i)) \simeq X'_\infty(i-1)_{G_\infty}$  [28, Section 6, Lemma 1] and by the local duality theorem, we have

$$H^2(F_v, \mathbb{Z}_p(i)) \cong H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))^\vee.$$

In particular, the group  $\bigoplus_{v \in S} H^2(F_v, \mathbb{Z}_p(i))$  is finite. Then, the equivalence 2)  $\iff$  3) follows from the exact sequence

$$0 \rightarrow \text{III}^2(G_S(F), \mathbb{Z}_p(i)) \rightarrow H^2(G_S(F), \mathbb{Z}_p(i)) \rightarrow \bigoplus_{v \in S} H^2(F_v, \mathbb{Z}_p(i)).$$

□

**Remark 2.3.** For an integer  $i$ , we denote by  $\mathcal{J}_F^{(i)}$  the  $\mathbb{Z}_p$ -torsion sub-module of  $\mathcal{X}_F^{(i)}$ . When the field  $F$  satisfies Conjecture C<sup>(i)</sup> ( $i \neq 1$ ), the cohomology group  $H^2(G_S(F), \mathbb{Z}_p(i))$  is finite. Hence the exact sequence (1) (for  $n = 1$ ) induces by duality the following well known cohomological description of  $\mathcal{J}_F^{(i)}$  [26, Lemme 4.1]

$$\mathcal{J}_F^{(i)} \simeq H^2(G_S(F), \mathbb{Z}_p(i))^\vee.$$

As in the case where  $i = 0$ , Conjecture C<sup>(i)</sup> is related to the  $\mathbb{Z}_p$ -rank of the module  $\mathcal{X}_F^{(i)}$ . In [28, §4, Satz 6], the co-ranks of the groups  $H^1(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i))$  were computed. By duality,

$$\text{rank}_{\mathbb{Z}_p} H_1(G_S(F), \mathbb{Z}_p(-i)) = \text{corank}_{\mathbb{Z}_p} H^1(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i)).$$

It follows that if  $i \neq 0, 1$ , the field  $F$  satisfies C<sup>(i)</sup> if and only if

$$\text{rank}_{\mathbb{Z}_p} \mathcal{X}_F^{(i)} = \begin{cases} r_2 + r_1 & \text{if } i \text{ is odd;} \\ r_2 & \text{if } i \text{ is even,} \end{cases} \tag{3}$$

here, as usual,  $r_1$  (resp.  $r_2$ ) is the number of real (resp. complex) places. In the sequel we will frequently use the following well known lemma:

**Lemma 2.4** (Tate’s lemma). *Let  $F$  be a number field and let  $i$  be a non-zero integer. Then the Galois cohomology groups  $H^k(G, \mathbb{Q}_p/\mathbb{Z}_p(i))$  vanish for all  $k \geq 1$ , where  $G$  is either  $G_\infty = \text{Gal}(E_\infty/F)$  or  $G_{\infty, v} = \text{Gal}(E_{\infty, v}/F_v)$ ,  $v$  being a finite prime of  $F$ .*

As a consequence of Tate’s lemma, we get that

$$H^1(\Gamma, H^0(G_S(F_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i))) = 0,$$

where  $\Gamma$  is the Galois group  $\text{Gal}(F_\infty/F)$ . Indeed, let  $\Delta$  be the Galois group  $\text{Gal}(E_\infty/F_\infty)$ . We have

$$\begin{aligned} H^0(G_S(F_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i)) &= H^0(\Delta, H^0(G_S(E_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i))) \\ &= H^0(\Delta, \mathbb{Q}_p/\mathbb{Z}_p(i)). \end{aligned} \tag{4}$$

Since  $\text{cd}(\Gamma) \leq 1$ , the Hochschild-Serre spectral sequence associated to the group extension

$$0 \rightarrow \Delta \rightarrow G_\infty \rightarrow \Gamma \rightarrow 0$$

yields the following exact sequence

$$0 \rightarrow H^1(\Gamma, H^0(\Delta, \mathbb{Q}_p/\mathbb{Z}_p(i))) \rightarrow H^1(G_\infty, \mathbb{Q}_p/\mathbb{Z}_p(i)) \rightarrow H^1(\Delta, \mathbb{Q}_p/\mathbb{Z}_p(i))^\Gamma \rightarrow 0.$$

By Tate’s Lemma, we get

$$H^1(\Gamma, H^0(\Delta, \mathbb{Q}_p/\mathbb{Z}_p(i))) = 0.$$

From the equality (4), it follows that

$$H^1(\Gamma, H^0(G_S(F_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i))) = 0$$

as required.

Recall that the  $\mathbb{Z}_p$ -module  $\mathcal{X}_F^{(0)}$  is isomorphic to  $\mathcal{X}_F = \text{Gal}(\widehat{F}/F)$ , where  $\widehat{F}$  is the maximal abelian pro- $p$ -extension of  $F$  which is unramified outside  $S$ . When the integer  $i$  is non-zero, the  $\mathbb{Z}_p$ -module  $\mathcal{X}_F^{(i)}$  can also be realized as a Galois group. Indeed, using Tate’s lemma we get that  $H^1(G_\infty, \mathbb{Q}_p/\mathbb{Z}_p(i)) = H^2(G_\infty, \mathbb{Q}_p/\mathbb{Z}_p(i)) = 0$ , since  $i \neq 0$ . Therefore, the restriction map

$$H^1(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i)) \rightarrow H^1(G_S(E_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i))^{G_\infty} \tag{5}$$

is an isomorphism. Notice that the Galois group  $G_S(E_\infty)$  acts trivially on  $\mathbb{Q}_p/\mathbb{Z}_p(i)$ , so we have

$$\begin{aligned} H^1(G_S(E_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i))^{G_\infty} &= H^1(G_S(E_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i))^{G_\infty} \\ &\simeq \text{Hom}(G_S(E_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i))^{G_\infty}. \end{aligned}$$

Then, by duality, the isomorphism (5) induces the following isomorphism:

$$\mathcal{X}_F^{(i)} \simeq \mathcal{X}_\infty(-i)_{G_\infty}, \tag{6}$$

where  $\mathcal{X}_\infty = H_1(G_S(E_\infty), \mathbb{Z}_p)$  is the Galois group over  $E_\infty$  of  $E_\infty^{ab}$ , the maximal abelian pro- $p$ -extension which is unramified outside  $S$ .

**Definition 2.5.** Let  $i \neq 0$  be an integer. We define the field  $\widehat{F}^{(i)}$  to be the subfield of  $E_\infty^{ab}$  fixed by  $I_{G_\infty}(\mathcal{X}_\infty(-i))$ ; hence

$$\text{Gal}(\widehat{F}^{(i)}/E_\infty) = \mathcal{X}_\infty(-i)_{G_\infty} \simeq \mathcal{X}_F^{(i)}.$$

When  $i = 0$ , we define  $\widehat{F}^{(0)}$  as the composite of the fields  $E_\infty$  and  $\widehat{F}$  i.e,  $\widehat{F}^{(0)} = E_\infty\widehat{F}$ .

For every integer  $i$ , we denote by  $\widetilde{F}^{(i)}$  the subfield of  $\widehat{F}^{(i)}$  fixed by the  $\mathbb{Z}_p$ -torsion sub-module  $\mathcal{J}_F^{(i)}$  of  $\mathcal{X}_F^{(i)}$ ; hence

$$\mathcal{J}_F^{(i)} \simeq \text{Gal}(\widehat{F}^{(i)}/\widetilde{F}^{(i)}).$$

**Remark 2.6.** In the case  $i = 0$ , we don’t have the isomorphism (6) but we do have the following exact sequence:

$$0 \rightarrow (\mathcal{X}_\infty)_{G_\infty} \rightarrow \mathcal{X}_F \rightarrow \Gamma \rightarrow 0.$$

It follows that the field  $\widehat{F}^{(0)}$  is the maximal subfield of  $E_\infty^{ab}$ , which is abelian over  $F$ .

Let  $X'_\infty$  be the Galois group  $\text{Gal}(L'_\infty/E_\infty)$ , where  $L'_\infty$  is the maximal abelian unramified pro- $p$ -extension of  $E_\infty$  which splits at  $p$ -adic primes of  $E_\infty$ . We have a natural surjective map

$$X_\infty(-i)_{G_\infty} \longrightarrow X'_\infty(-i)_{G_\infty}.$$

For  $i \neq 0$ , it is well known that  $X'_\infty(-i)_{G_\infty}$  is isomorphic to the localization kernel

$$\text{III}^2(G_S(F), \mathbb{Z}_p(1-i)) := \ker(H^2(G_S(F), \mathbb{Z}_p(1-i)) \longrightarrow \bigoplus_{v|p} H^2(F_v, \mathbb{Z}_p(1-i))),$$

[28, Section 6, Lemma 1]. For  $i \geq 2$ , the group  $\text{III}^2(G_S(F), \mathbb{Z}_p(i))$  is called the étale wild kernel and does not depend on  $S$  containing the  $p$ -adic places.

In the following proposition, we give an exact sequence which expresses the link between the  $\mathbb{Z}_p$ -torsion module  $\mathcal{J}_F^{(i)}$  and the Pontryagin dual of  $X'_\infty(i-1)_{G_\infty}$ . Let  $W^{(1-i)}$  be the co-kernel of the injective localization morphism

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i)),$$

so that  $W^{(1-i)} \cong \left( \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \right) / H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)).$

**Proposition 2.7.** *Let  $F$  be a number field and let  $i \neq 1$  be an integer such that  $F$  satisfies Conjecture  $C^{(i)}$ . Then we have the following exact sequence:*

$$0 \rightarrow W^{(1-i)} \rightarrow \mathcal{J}_F^{(i)} \rightarrow \text{Hom}(X'_\infty(i-1)_{G_\infty}, \mathbb{Q}_p/\mathbb{Z}_p) \rightarrow 0. \tag{7}$$

**Proof.** We start by recalling the first part of the Poitou-Tate exact sequence:

$$\begin{array}{ccc} 0 \rightarrow H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) & \longrightarrow & \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \\ & & \searrow \\ & & H^2(G_S(F), \mathbb{Z}_p(i))^\vee \longrightarrow \text{III}^1(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow 0. \end{array}$$

Clearly, for  $i \neq 1$ , we have

$$\text{III}^1(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \cong \text{Hom}(X'_\infty(i-1)_{G_\infty}, \mathbb{Q}_p/\mathbb{Z}_p).$$

Furthermore, if the field  $F$  satisfies Conjecture  $C^{(i)}$ , Remark 2.3 gives an isomorphism

$$\mathcal{J}_F^{(i)} \simeq H^2(G_S(F), \mathbb{Z}_p(i))^\vee$$

Summarizing, we can rewrite the Poitou-Tate exact sequence as follows:

$$0 \rightarrow W^{(1-i)} \rightarrow \mathcal{J}_F^{(i)} \rightarrow \text{Hom}(X'_\infty(i-1)_{G_\infty}, \mathbb{Q}_p/\mathbb{Z}_p) \rightarrow 0.$$

□

Note that the group  $X'_\infty(-i)_{G_\infty}$  is a quotient of the Galois group  $X'_\infty$ , thus it could be realized as a Galois group of an abelian and totally decomposed extension of  $E_\infty$  (this extension is denoted by  $\mathcal{L}_\infty$  in [3, Section 2, page 653]).

**Definition 2.8.** *The field  $L^{(i)}$  is the subfield of  $L'_\infty$  fixed by  $I_{G_\infty}(X'_\infty(-i))$ , hence*

$$\text{Gal}(L^{(i)}/E_\infty) = X'_\infty(-i)_{G_\infty}.$$

In [3, Proposition 1], it is noticed that the extension  $L^{(i)}$  is not in general abelian over  $F$  so we can not use the descent process to realize the group  $X'_\infty(-i)_{G_\infty}$  as a Galois group over  $F$ . Using the same methods of Jaulent and Soriano [15, Section 3, page 3], one constructs a field  $H^{(i)}$  (this field is denoted by  $\tilde{F}$  in [3, Section 2, page 653]) which is a Galois extension over  $F$  and the group  $X'_\infty(-i)_{G_\infty}$  is isomorphic to the Galois group  $\text{Gal}(H^{(i)}/E_{n_0})$ , where  $E_{n_0} = H^{(i)} \cap E_\infty$  [3, Proposition 2]. Mention that in [3, page 653] the author assumes that  $\mu_p \subseteq F$  but the generalization is easy. Let us recall the precise definition of the field  $H^{(i)}$ .

**Definition 2.9.** *The field  $H^{(i)}$  is the composite of the fields  $F_\gamma$ , where  $F_\gamma$  is the subfield of  $L^{(i)}$  fixed by a lifting of a topological generator  $\gamma$  of  $\Gamma$ .*

**Remark 2.10.** *Since the Galois groups  $\text{Gal}(L^{(i)}/E_\infty)$  and  $\text{Gal}(H^{(i)}/E_{n_0})$  are isomorphic, and  $E_{n_0} = H^{(i)} \cap E_\infty$ , we have  $L^{(i)} = E_\infty H^{(i)}$ .*

Let  $K/F$  be a cyclic  $p$ -extension of  $F$ . Following [9], we say that  $K$  is an infinitely embeddable extension of  $F$  if it is embeddable in a cyclic  $p$ -extension of  $F$  of arbitrary large degree. By class field theory, a  $p$ -extension  $K/F$  is infinitely embeddable if and only if for any place  $v$  of  $F$ , the local extension  $K_v/F_v$  is embeddable in a  $\mathbb{Z}_p$ -extension of  $F_v$ . We denote by  $F^{\text{BP}}$  the composite of all infinitely embeddable extensions of  $F$ . Obviously the field  $F^{\text{BP}}$  contains the composite  $\tilde{F}$  of all  $\mathbb{Z}_p$ -extensions of  $F$ . We set  $T_F := \text{Gal}(F^{\text{BP}}/\tilde{F})$  to be the Bertrandias-Payan module of  $F$  i.e., the  $\mathbb{Z}_p$ -torsion sub-module of  $\text{Gal}(F^{\text{BP}}/F)$ . Let  $\hat{F}$  be the maximal abelian pro- $p$ -extension of  $F$  which is unramified outside  $S$ . In view of [25, Theorem 4.2], we can see that  $F^{\text{BP}}$  is the subfield of  $\hat{F}$  fixed by the image of  $W^{(1)} = \bigoplus_{v|p} \mu_p(F_v)/\mu_p(F)$  in  $\mathcal{J}_F$ , the  $\mathbb{Z}_p$ -torsion sub-module of  $\mathcal{X}_F := \text{Gal}(\hat{F}/F)$ .

In a natural way, we define a twisted analogue of the Bertrandias-Payan field as follows:

**Definition 2.11.** *Let  $i \neq 1$  be an integer such that  $F$  satisfies Conjecture  $C^{(i)}$ . The twisted Bertrandias-Payan field  $F^{\text{BP},(i)}$  is defined as the subfield of  $\hat{F}^{(i)}$  fixed by the image of  $W^{(1-i)}$  in  $\mathcal{J}_F^{(i)}$  in the exact sequence (7).*

Let  $T_F^{(i)}$  be the  $\mathbb{Z}_p$ -torsion of  $\text{Gal}(F^{\text{BP},(i)}/E_\infty)$ . Assume that  $F$  satisfies Conjecture  $C^{(i)}$ . By the definition of  $F^{\text{BP},(i)}$  and the exact sequence (7), we have the following isomorphism:

$$T_F^{(i)} \simeq \text{Hom}(X'_\infty(i-1)_{G_\infty}, \mathbb{Q}_p/\mathbb{Z}_p).$$

In particular, if  $i = 0$  we obtain the following isomorphism:

$$T_F \simeq \text{Hom}(X'_\infty(-1)_{G_\infty}, \mathbb{Q}_p/\mathbb{Z}_p),$$

(c.f. [25, Theorem 4.2]). Hence  $T_F^{(i)}$  is a twisted analogue of the Bertrandias-Payan module. In this context, we have the twist analogue of the exact sequence in [25, Theorem 4.2].

**Corollary 2.12.** *Let  $F$  be a number field and let  $i \neq 1$  be an integer such that  $F$  satisfies Conjecture  $C^{(i)}$ . Then, we have the following exact sequence:*

$$0 \rightarrow W^{(1-i)} \rightarrow \mathcal{J}_F^{(i)} \rightarrow T_F^{(i)} \rightarrow 0. \quad (8)$$

**Proposition 2.13.** *For every integer  $i \neq 0, 1$  such that  $F$  satisfies Conjecture  $C^{(i)}$ , the twisted Bertrandias-Payan field  $F^{\text{BP},(i)}$  contains the field  $L^{(i)}$ .*

**Proof.** Since  $i \neq 0$ , we have  $\text{III}^2(G_S(F), \mathbb{Z}_p(1-i)) \simeq X'_\infty(-i)_{G_\infty}$ . Thus, the Poitou-Tate exact sequence [19, page 682]

$$\begin{array}{c} H^1(G_S(F), \mathbb{Z}_p(1-i)) \xrightarrow{\alpha^{(1-i)}} \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(1-i)) \rightarrow \mathcal{X}_F^{(i)} \\ \curvearrowright \\ \rightarrow \text{III}^2(G_S(F), \mathbb{Z}_p(1-i)) \longrightarrow 0 \end{array}$$

induces a surjective homomorphism:

$$\mathcal{X}_F^{(i)} \twoheadrightarrow X'_\infty(-i)_{G_\infty}.$$

Its kernel  $Y^{(i)} := \text{Gal}(\widehat{F}^{(i)}/L^{(i)})$  is isomorphic to the co-kernel of the localization map

$$H^1(G_S(F), \mathbb{Z}_p(1-i)) \rightarrow \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(1-i)).$$

This map is injective since Conjecture  $C^{(i)}$  holds. Thus we have an exact sequence:

$$0 \rightarrow H^1(G_S(F), \mathbb{Z}_p(1-i)) \rightarrow \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(1-i)) \rightarrow Y^{(i)} \rightarrow 0.$$

Taking the restriction to the  $\mathbb{Z}_p$ -torsion sub-modules, we obtain the following exact sequence:

$$\text{tor}_{\mathbb{Z}_p} H^1(G_S(F), \mathbb{Z}_p(1-i)) \hookrightarrow \bigoplus_{v|p} \text{tor}_{\mathbb{Z}_p} H^1(F_v, \mathbb{Z}_p(1-i)) \rightarrow \text{tor}_{\mathbb{Z}_p} Y^{(i)}. \quad (9)$$

Moreover, we have the following well known isomorphisms

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \simeq \text{tor}_{\mathbb{Z}_p} H^1(G_S(F), \mathbb{Z}_p(1-i))$$

and

$$H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \simeq \text{tor}_{\mathbb{Z}_p} H^1(F_v, \mathbb{Z}_p(1-i))$$

[31, Proposition 2.3]. The exact sequence (9) becomes

$$0 \rightarrow H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow \text{tor}_{\mathbb{Z}_p} Y^{(i)}.$$

Then we obtain that the image of  $W^{(1-i)}$  in  $\mathcal{X}_F^{(i)}$  is contained in the  $\mathbb{Z}_p$ -torsion of the kernel  $Y^{(i)} := \text{Gal}(\widehat{F}^{(i)}/L^{(i)})$ . This means that the field  $L^{(i)}$  is contained in  $F^{\text{BP},(i)}$ .  $\square$

The following figure is an illustration of the situation in which we work:

Now, let  $K/F$  be a Galois  $p$ -extension of number fields, with Galois group  $G$ . If the extension  $K/F$  is unramified outside  $S$ , there exists a natural restriction map

$$f_i : H^2(G_S(F), \mathbb{Z}_p(i)) \longrightarrow H^2(G_S(K), \mathbb{Z}_p(i))^G.$$

We denote by  $\hat{H}(G, \cdot)$  the modified Tate cohomology groups (see [29]). If  $i \neq 0, 1$ , the kernel and co-kernel of the map  $f_i$  are given by

$$\ker(f_i) \cong H^1(G, H^1(G_S(K), \mathbb{Z}_p(i))) \cong \hat{H}^{-1}(G, H^2(G_S(K), \mathbb{Z}_p(i)))$$

and

$$\text{coker}(f_i) \cong H^2(G, H^1(G_S(K), \mathbb{Z}_p(i))) \cong \hat{H}^0(G, H^2(G_S(K), \mathbb{Z}_p(i)))$$

[1, Proposition 3.1, page 41], [18, Theorem 1.2] and [16, Proposition 2.9] (the proof for  $i \neq 0, 1$  is the same as for  $i \geq 2$ ). If  $K$  satisfies Conjecture  $C^{(i)}$ , the group  $H^2(G_S(K), \mathbb{Z}_p(i))$  is finite and the above descriptions of the kernel and co-kernel of the map  $f_i$  show that, if  $G$  is cyclic,  $\ker(f_i)$  and  $\text{coker}(f_i)$  have the same order.

Similarly for a prime  $v$  of  $F$  dividing  $p$  and a prime  $w$  of  $K$  above  $v$ , we have a restriction map [1, Chapter 3]

$$f_{i,v} : H^2(F_v, \mathbb{Z}_p(i)) \longrightarrow H^2(K_w, \mathbb{Z}_p(i))^{G_w}$$

where  $G_w = \text{Gal}(K_w/F_v)$  is the decomposition group of  $w$  in the extension  $K/F$ . Then exactly as in the global case, we have [1, Proposition 3.1, page 41]

$$\ker(f_{i,v}) \cong H^1(G_w, H^1(K_w, \mathbb{Z}_p(i))) \cong \hat{H}^{-1}(G_w, H^2(K_w, \mathbb{Z}_p(i)))$$

and

$$\text{coker}(f_{i,v}) \cong H^2(G_w, H^1(K_w, \mathbb{Z}_p(i))) \cong \hat{H}^0(G_w, H^2(K_w, \mathbb{Z}_p(i))).$$

Consider the commutative diagram

$$\begin{array}{ccc} H^2(G_S(K), \mathbb{Z}_p(i))^G & \rightarrow & [\bigoplus_{v \in S, w|v} H^2(K_w, \mathbb{Z}_p(i))]^G \cong \bigoplus_{v \in S} H^2(K_w, \mathbb{Z}_p(i))^{G_w} \\ f_i \uparrow & & \bigoplus_{v \in S} f_{i,v} \uparrow \\ H^2(G_S(F), \mathbb{Z}_p(i)) & \longrightarrow & \bigoplus_{v \in S} H^2(F_v, \mathbb{Z}_p(i)) \end{array}$$

where for each  $v \in S$ , the isomorphism  $[\bigoplus_{w|v} H^2(K_w, \mathbb{Z}_p(i))]^G \cong H^2(K_w, \mathbb{Z}_p(i))^{G_w}$  is a consequence of Shapiro's lemma,  $w$  being a prime of  $K$  above  $v$ . It follows that there exists a restriction map

$$j_i(K/F) : \text{III}^2(G_S(F), \mathbb{Z}_p(i)) \longrightarrow \text{III}^2(G_S(K), \mathbb{Z}_p(i))^G.$$

We are interested in the dual map

$$j_i^*(K/F) : (\mathbb{T}_K^{(i)})_G \longrightarrow \mathbb{T}_F^{(i)}$$

when  $K$  is contained in the cyclotomic  $\mathbb{Z}_p$ -extension  $F_\infty$  of  $F$ .

We need some additional notation. For all positive integer  $n$ , we denote by  $F_n$  the unique sub-extension of  $F_\infty$  such that  $G_n := \text{Gal}(F_n/F) \simeq \mathbb{Z}/p^n\mathbb{Z}$  and by  $\mathbb{T}_n^{(i)} := \mathbb{T}_{F_n}^{(i)}$  the twisted Bertrandias-Payan module of  $F_n$ . We define the twisted Bertrandias-Payan module of  $F_\infty$  as the projective limit of  $\mathbb{T}_n^{(i)}$  i.e.,  $\mathbb{T}_\infty^{(i)} := \varprojlim \mathbb{T}_n^{(i)}$ , where the projective limit is taken via the natural maps  $J_{i,n}^* := j_i^*(F_n/F) : (\mathbb{T}_n^{(i)})_{G_n} \rightarrow \mathbb{T}_m^{(i)}$  ( $n \geq m$ ). Let  $\Gamma$  be the Galois group  $\text{Gal}(F_\infty/F)$ . Then we have a well-defined homomorphism

$$J_{i,\infty}^* : (\mathbb{T}_\infty^{(i)})_\Gamma \rightarrow \mathbb{T}_F^{(i)}.$$

In the next lemma we show that  $J_{i,\infty}^*$  is injective, or equivalently that the restriction map

$$j_{i,\infty} : \text{III}^2(G_S(F), \mathbb{Z}_p(i)) \longrightarrow (\varprojlim \text{III}^2(G_S(F_n), \mathbb{Z}_p(i)))^\Gamma$$

induced by the maps  $j_i(F_n/F)$  is surjective provided that Conjecture  $C^{(i)}$  holds. More precisely,

**Lemma 2.14.** *Suppose that for every  $n \geq 0$ , the field  $F_n$  satisfies Conjecture  $C^{(i)}$ ,  $i \neq 0, 1$ . Then, we have a commutative diagram with exact lines*

$$\begin{array}{ccccc} \ker(j_{i,\infty}) & \hookrightarrow & \text{III}^2(G_S(F), \mathbb{Z}_p(i)) & \xrightarrow{j_{i,\infty}} & (\varinjlim \text{III}^2(G_S(F_n), \mathbb{Z}_p(i)))^\Gamma \\ \downarrow & & \downarrow g & & \downarrow \\ H^1(\Gamma, \varinjlim H^1(G_S(F_n), \mathbb{Z}_p(i))) & \hookrightarrow & H^2(G_S(F), \mathbb{Z}_p(i)) & \xrightarrow{f_{i,\infty}} & (\varinjlim H^2(G_S(F_n), \mathbb{Z}_p(i)))^\Gamma \end{array}$$

where  $f_{i,\infty}$  is induced by the restriction maps

$$f_{i,n} : H^2(G_S(F), \mathbb{Z}_p(i)) \longrightarrow H^2(G_S(F_n), \mathbb{Z}_p(i))^{G_n}.$$

**Proof.** Let  $v$  be a  $p$ -adic prime of  $F$  and let  $n \geq 0$ . For commodity of notation, we denote also by  $v$  a prime of  $F_n$  above  $v$  and by  $G_{n,v} = \text{Gal}(F_{n,v}/F_v)$  its decomposition group in the extension  $F_n/F$ . Let us first show that the restriction homomorphism

$$f_{i(F_{n,v}/F_v)} : H^2(F_v, \mathbb{Z}_p(i)) \longrightarrow H^2(F_{n,v}, \mathbb{Z}_p(i))^{G_{n,v}}$$

is injective. The local duality theorem gives an isomorphism

$$H^2(F_{n,v}, \mathbb{Z}_p(i)) \cong H^0(F_{n,v}, \mathbb{Q}_p/\mathbb{Z}_p(1-i))^\vee \cong H^0(F_{n,v}, \mathbb{Q}_p/\mathbb{Z}_p(i-1)).$$

Using Tate's lemma and the Hochschild-Serre spectral sequence associated to the extension groups

$$\text{Gal}(E_{\infty,v}/F_{n,v}) \hookrightarrow G_{\infty,v} \twoheadrightarrow G_{n,v},$$

we see that the first cohomology group  $H^1(G_{n,v}, H^0(F_{n,v}, \mathbb{Q}_p/\mathbb{Z}_p(i-1))) = 0$ . Since  $G_{n,v}$  is a cyclic group, it follows that

$$\hat{H}^{-1}(G_{n,v}, H^0(F_{n,v}, \mathbb{Q}_p/\mathbb{Z}_p(i-1))) = 0.$$

Summarizing, we obtain

$$\begin{aligned} \ker\left(\bigoplus_{v \in S} f_{i(F_{n,v}/F_v)}\right) &:= \bigoplus_{v \in S} \hat{H}^{-1}(G_{n,v}, H^2(F_{n,v}, \mathbb{Z}_p(i))) \\ &\simeq \bigoplus_{v \in S} \hat{H}^{-1}(G_{n,v}, H^0(F_{n,v}, \mathbb{Q}_p/\mathbb{Z}_p(i-1))) \\ &= 0. \end{aligned}$$

Now, the exact sequence

$$\begin{array}{c} 0 \twoheadrightarrow \text{III}^2(G_S(F_n), \mathbb{Z}_p(i)) \longrightarrow H^2(G_S(F_n), \mathbb{Z}_p(i)) \longrightarrow \\ \bigoplus_{v \in S} H^2(F_{n,v}, \mathbb{Z}_p(i)) \longrightarrow H^0(G_S(F_n), \mathbb{Q}_p/\mathbb{Z}_p(1-i))^\vee \twoheadrightarrow 0 \end{array}$$

leads to the following commutative diagram:

$$\begin{array}{ccccc} \text{III}^2(G_S(F_n), \mathbb{Z}_p(i))^{G_n} & \hookrightarrow & H^2(G_S(F_n), \mathbb{Z}_p(i))^{G_n} & \rightarrow & \bigoplus_{v \in S} H^2(F_{n,v}, \mathbb{Z}_p(i))^{G_n} & (10) \\ \uparrow j_{i,n} & & \uparrow f_{i,n} & & \uparrow \bigoplus_{v \in S} f_{i(F_{n,v}/F_v)} & \\ \text{III}^2(G_S(F), \mathbb{Z}_p(i)) & \hookrightarrow & H^2(G_S(F), \mathbb{Z}_p(i)) & \twoheadrightarrow & \bigoplus_{v \in S} H^2(F_v, \mathbb{Z}_p(i)), & \end{array}$$

where

$$\bigoplus_{v \in S} H^2(F_v, \mathbb{Z}_p(i)) := \ker(\bigoplus_{v \in S} H^2(F_v, \mathbb{Z}_p(i)) \rightarrow H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i))^\vee).$$

The map  $\bigoplus_{v \in S} f_{i(F_{n,v}/F_v)}$  is injective as the restriction of the map  $\bigoplus_{v \in S} f_{i(F_{n,v}/F_v)}$  to  $\bigoplus_{v \in S} H^2(F_v, \mathbb{Z}_p(i))$ . Since the fields  $F_n$ ,  $n \geq 0$ , satisfy Conjecture  $C^{(i)}$ , the group

$$\varinjlim \text{coker}(f_{i,n}) = \varinjlim H^2(G_n, H^1(G_S(F_n), \mathbb{Z}_p(i)))$$

is trivial (the proof is exactly the same as [18, Proposition 3.2]). Taking the inductive limit in (10), we then obtain the following commutative diagram with exact lines and columns

$$\begin{array}{ccccc} \varinjlim \text{III}^2(G_S(F_n), \mathbb{Z}_p(i))^{G_n} & \hookrightarrow & \varinjlim H^2(G_S(F_n), \mathbb{Z}_p(i))^{G_n} & \rightarrow & \varinjlim \bigoplus_{v \in S} H^2(F_{n,v}, \mathbb{Z}_p(i))^{G_n} \\ \uparrow j_{i,\infty} & & \uparrow f_{i,\infty} & & \uparrow \bigoplus_{v \in S} f_{i(F_{\infty,v}/F_v)} \\ \text{III}^2(G_S(F), \mathbb{Z}_p(i)) & \hookrightarrow & H^2(G_S(F), \mathbb{Z}_p(i)) & \twoheadrightarrow & \bigoplus_{v \in S} H^2(F_v, \mathbb{Z}_p(i)) \\ \uparrow \text{ker}(j_{i,\infty}) & \hookrightarrow & H^1(\Gamma, \varinjlim H^1(G_S(F_n), \mathbb{Z}_p(i))) & & \end{array}$$

which shows that the map  $\text{III}^2(G_S(F), \mathbb{Z}_p(i)) \rightarrow \varinjlim \text{III}^2(G_S(F_n), \mathbb{Z}_p(i))^{G_n}$  is surjective. Therefore, we get the commutative diagram of the lemma.  $\square$

**Theorem 2.15.** *Let  $F$  be a number field and let  $i \neq 0, 1$  be an integer such that Conjecture  $C^{(i)}$  holds for all the fields  $F_n$ ,  $n \geq 0$ . Then the homomorphism*

$$j_{i,\infty}^* : (\mathbb{T}_\infty^{(i)})_\Gamma \rightarrow \mathbb{T}_F^{(i)}$$

is injective. If we assume further that  $F$  is totally real and  $i$  is even, we get an isomorphism

$$(\mathbb{T}_\infty^{(i)})_\Gamma \simeq \mathbb{T}_F^{(i)}.$$

**Proof.** The first claim follows from the Pontryagin dual of the top exact sequence in the commutative diagram of Lemma 2.14 and the isomorphisms

$$\mathbb{T}_F^{(i)} \simeq \text{III}^2(G_S(F), \mathbb{Z}_p(i))^\vee,$$

$$\mathbb{T}_\infty^{(i)} \simeq \varprojlim (\text{III}^2(G_S(F_n), \mathbb{Z}_p(i))^\vee) \simeq \text{Hom}(\varinjlim \text{III}^2(G_S(F_n), \mathbb{Z}_p(i)), \mathbb{Q}_p/\mathbb{Z}_p).$$

Suppose now that  $F$  is totally real and  $i$  is even. Observe that, for every  $n \geq 1$ ,  $F_n$  is also totally real. Using the exact sequence (1), we obtain

$$\begin{aligned} \text{rank}_{\mathbb{Z}_p} H^1(G_S(F_n), \mathbb{Z}_p(i)) &= \text{co-rank} H^1(G_S(F_n), \mathbb{Q}_p/\mathbb{Z}_p(i)) \\ &= \text{rank}_{\mathbb{Z}_p} H_1(G_S(F_n), \mathbb{Z}_p(-i)). \end{aligned}$$

Thus, the formula (3) shows that for  $n \geq 1$ , the group  $H^1(G_S(F_n), \mathbb{Z}_p(i))$  is a  $\mathbb{Z}_p$ -torsion module. Note that for all  $n \geq 1$ ,  $H^0(G_S(F_n), \mathbb{Z}_p(i)) \otimes \mathbb{Q}_p/\mathbb{Z}_p$  is trivial. From the exact sequence (1), it follows that the connecting homomorphism is an isomorphism

$$H^0(G_S(F_n), \mathbb{Q}_p/\mathbb{Z}_p(i)) \simeq H^1(G_S(F_n), \mathbb{Z}_p(i)).$$

Hence we have a commutative diagram

$$\begin{array}{ccc} H^0(G_S(F_n), \mathbb{Q}_p/\mathbb{Z}_p(i)) & \xrightarrow{\sim} & H^1(G_S(F_n), \mathbb{Z}_p(i)) \\ \uparrow & & \uparrow \\ H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i)) & \xrightarrow{\sim} & H^1(G_S(F), \mathbb{Z}_p(i)) \end{array}$$

where the vertical maps are the restriction maps. Taking the inductive limit, we get

$$\begin{aligned} \varinjlim H^1(G_S(F_n), \mathbb{Z}_p(i)) &\simeq \varinjlim H^0(G_S(F_n), \mathbb{Q}_p/\mathbb{Z}_p(i)) \\ &\simeq H^0(G_S(F_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i)). \end{aligned}$$

Therefore,

$$H^1(\Gamma, \varinjlim H^1(G_S(F_n), \mathbb{Z}_p(i))) \simeq H^1(\Gamma, H^0(G_S(F_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i))).$$

As explained after Lemma 2.4,  $H^1(\Gamma, H^0(G_S(F_\infty), \mathbb{Q}_p/\mathbb{Z}_p(i)))$  is trivial. Thus, the cohomology group  $H^1(\Gamma, \varinjlim H^1(G_S(F_n), \mathbb{Z}_p(i)))$  is trivial. Using this fact and Lemma 2.14, we obtain that

$$j_{i,\infty} : \text{III}^2(G_S(F), \mathbb{Z}_p(i)) \longrightarrow (\varinjlim \text{III}^2(G_S(F_n), \mathbb{Z}_p(i)))^\Gamma$$

is an isomorphism. Taking the Pontryagin dual we get the desired isomorphism.  $\square$

### 3. The twisted Kummer-Leopoldt’s constant

Let  $F$  be a number field and let  $S$  be the set of  $p$ -adic and infinite places of  $F$ . We set by  $A_F$  the  $p$ -primary part of the  $(p)$ -class group of  $F$ . We denote by  $U$  the group of  $S$ -units of  $F$  and by  $\hat{U}$  the pro- $p$ -completion of  $U$ .

A description of the Galois group  $\mathcal{X}_F$  is given by the class field exact sequence relative to the decomposition

$$\hat{U} \xrightarrow{\alpha} \bigoplus_{v|p} \hat{F}_v \xrightarrow{\varphi} \mathcal{X}_F \longrightarrow A_F \longrightarrow 0, \tag{11}$$

where  $\alpha$  is the natural pro- $p$ -diagonal map and  $\varphi$  is the product of the local reciprocity homomorphisms which send each  $\widehat{F}_v$  to the decomposition group in  $\mathcal{X}_F$ .

In Section 2, we noticed some equivalences formulations of Leopoldt’s conjecture in terms of the  $\mathbb{Z}_p$ -rank of the  $p$ -ramified Iwasawa module and cohomology groups. Another formulation of this conjecture is the injectivity of the natural pro- $p$ -diagonal map  $\alpha$  or, equivalently, is the validity of the following property: For all integer  $s \geq 1$ , there exists an integer  $t \geq 1$  such that:

$$\forall u \in U, (u \in F_v^{p^t}, \forall v \mid p) \implies u \in U^{p^s},$$

[7, Section 4]. Using the isomorphism

$$\widehat{U} \cong H^1(G_S(F), \mathbb{Z}_p(1)),$$

the map  $\alpha$  is nothing but the localization homomorphism:

$$\begin{aligned} \alpha^{(1)} = \bigoplus_{v \mid p} \alpha_v^{(1)} : H^1(G_S(F), \mathbb{Z}_p(1)) &\longrightarrow \bigoplus_{v \mid p} H^1(F_v, \mathbb{Z}_p(1)) \\ x &\longmapsto (\alpha_v^{(1)}(x))_v \end{aligned}$$

For an integer  $i$ , we consider the twisted analogue of the map  $\alpha$

$$\begin{aligned} \alpha^{(i)} = \bigoplus_{v \mid p} \alpha_v^{(i)} : H^1(G_S(F), \mathbb{Z}_p(i)) &\longrightarrow \bigoplus_{v \mid p} H^1(F_v, \mathbb{Z}_p(i)) \\ x &\longmapsto (\alpha_v^{(i)}(x))_v \end{aligned}$$

and if  $x \in H^1(G_S(F), \mathbb{Z}_p(i))$ , we keep (for simplicity) the notation  $x := \alpha_v^{(i)}(x) \in H^1(F_v, \mathbb{Z}_p(i))$ . Then, we consider the following property:

( $\mathfrak{Q}_i$ ) For all integer  $s \geq 1$ , there exists an integer  $t \geq 1$  such that:

$$x \in H^1(G_S(F), \mathbb{Z}_p(i)) (x \in H^1(F_v, \mathbb{Z}_p(i))^{p^t}, \forall v \mid p) \implies x \in H^1(G_S(F), \mathbb{Z}_p(i))^{p^s}$$

**Remark 3.1.** Notice that for all  $t' \geq t$ , we have

$$H^1(F_v, \mathbb{Z}_p(i))^{p^{t'}} \subseteq H^1(F_v, \mathbb{Z}_p(i))^{p^t}.$$

Therefore, we can suppose that  $t \geq s$  in the property ( $\mathfrak{Q}_i$ ).

For every integer  $i$ , the Poitou-Tate exact sequence with coefficients in the modules  $\mathbb{Z}/p^n\mathbb{Z}(i)$  induces, by passing to the projective limit, the following exact sequence [19, page 682]

$$H^1(G_S(F), \mathbb{Z}_p(i)) \xrightarrow{\alpha^{(i)}} \bigoplus_{v \mid p} H^1(F_v, \mathbb{Z}_p(i)) \rightarrow \mathcal{X}_F^{(1-i)} \gg \text{III}^2(G_S(F), \mathbb{Z}_p(i)) \quad (12)$$

When  $i = 1$ ,  $\text{III}^2(G_S(F), \mathbb{Z}_p(i)) \simeq A_F$  and the exact sequence (12) is nothing but the class field theory exact sequence (11). For  $i \neq 1$ ,

$$\text{III}^2(G_S(F), \mathbb{Z}_p(i)) \simeq X'_\infty(i-1)_{G_\infty}$$

[28, Section 6, Lemma 1] and we have a twisted analogue of (11):

$$H^1(G_S(F), \mathbb{Z}_p(i)) \xrightarrow{\alpha^{(i)}} \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i)) \longrightarrow \mathcal{X}_F^{(1-i)} \longrightarrow X'_\infty(i-1)_{G_\infty} \longrightarrow 0.$$

In the next lemma, for  $i \neq 0$ , we show an equivalence between the validity of Conjecture  $C^{(1-i)}$  and the injectivity of the localization map:

$$\alpha^{(i)} : H^1(G_S(F), \mathbb{Z}_p(i)) \longrightarrow \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i)).$$

**Lemma 3.2.** *Let  $i \neq 0$  be an integer. The following assertions are equivalent:*

- i) *The map  $\alpha^{(i)}$  is injective.*
- ii) *Conjecture  $C^{(1-i)}$  holds for  $(F, p)$ .*

**Proof.** Remark that for every  $p$ -adic prime  $v$  of  $F$ , the absolute Galois group of  $F_v$  acts non trivially on  $\mathbb{Z}_p(i)$  when  $i \neq 0$ . Hence the cohomology group  $H^0(F_v, \mathbb{Z}_p(i))$  is trivial for every  $p$ -adic prime  $v$ . Therefore, the Poitou-Tate exact sequence induces the following exact sequence

$$0 \rightarrow H^2(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i))^\vee \rightarrow H^1(G_S(F), \mathbb{Z}_p(i)) \xrightarrow{\alpha^{(i)}} \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i)).$$

This shows that

$$\ker(\alpha^{(i)}) \cong H^2(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i))^\vee.$$

□

**Remark 3.3.** *Although there is no Conjecture  $C^{(1)}$ , the map  $\alpha^{(0)}$  is always injective. Indeed, by the global Poitou-Tate duality, we have*

$$\ker(\alpha^{(0)}) := \text{III}^1(G_S(F), \mathbb{Z}_p) \simeq \text{III}^2(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1))^\vee.$$

Furthermore,

$$\begin{aligned} \text{III}^2(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1)) &= \varinjlim \text{III}^2(G_S(F), \mu_{p^m}) \\ &= \varinjlim \text{III}^1(G_S(F), \mathbb{Z}/p^m\mathbb{Z})^\vee \\ &= \varinjlim Cl_S(F)/p^m \\ &= Cl_S(F) \otimes \mathbb{Q}_p/\mathbb{Z}_p \\ &= 0. \end{aligned}$$

In the next theorem we give other equivalences of the twisted Leopoldt’s conjecture. The proof is an adaptation of that of [7, Proposition 1].

**Theorem 3.4.** *Let  $F$  be a number field. For all integer  $i \neq 0$ , the following properties are equivalent:*

- (i) *Conjecture  $C^{(1-i)}$  holds for  $(F, p)$ .*
- (ii) *The property  $(\mathfrak{R}_i)$  is true.*
- (iii) *There exists a positive integer  $c_i$  such that for all  $n \geq 1$ ,*

$$x \in H^1(G_S(F), \mathbb{Z}_p(i))(x \in H^1(F_v, \mathbb{Z}_p(i))^{p^{c_i+n}}, \forall v | p) \Rightarrow x \in H^1(G_S(F), \mathbb{Z}_p(i))^{p^n}$$

(iv) There exists a positive integer  $c_i$  such that for all  $n \gg 0$ ,

$$x \in H^1(G_S(F), \mathbb{Z}_p(i)) (x \in H^1(F_v, \mathbb{Z}_p(i))^{p^{c_i+n}}, \forall v \mid p) \Rightarrow x \in H^1(G_S(F), \mathbb{Z}_p(i))^{p^n}$$

**Proof.** For a positive integer  $t$ , the homomorphism  $\alpha^{(i)}$  induces the following one

$$\alpha_t^{(i)} : H^1(G_S(F), \mathbb{Z}_p(i))/p^t \longrightarrow \bigoplus_{v \mid p} H^1(F_v, \mathbb{Z}_p(i))/p^t.$$

For integers  $t \geq s \geq 1$ , we consider the following commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & \ker(\alpha_t^{(i)}) & \longrightarrow & H^1(G_S(F), \mathbb{Z}_p(i))/p^t & \xrightarrow{\alpha_t^{(i)}} & \bigoplus_{v \mid p} H^1(F_v, \mathbb{Z}_p(i))/p^t \\ & & \downarrow a_{s,t} & & \downarrow b_{s,t} & & \downarrow c_{s,t} \\ 0 & \longrightarrow & \ker(\alpha_s^{(i)}) & \longrightarrow & H^1(G_S(F), \mathbb{Z}_p(i))/p^s & \xrightarrow{\alpha_s^{(i)}} & \bigoplus_{v \mid p} H^1(F_v, \mathbb{Z}_p(i))/p^s \end{array}$$

where the vertical maps are the natural ones. Since  $\ker \alpha^{(i)} = \varprojlim \ker \alpha_t^{(i)}$ , the homomorphism  $\alpha^{(i)}$  is injective if and only if the homomorphism  $a_{s,t}$  is trivial for  $t \gg s$ . According to Lemma 3.2, it follows that the validity of Conjecture  $C^{(1-i)}$  is equivalent to the triviality of the homomorphism  $a_{s,t}$  for  $t \gg s$ . Hence we get the equivalence (i)  $\iff$  (ii).

Now we prove the implication (ii)  $\implies$  (iii). We suppose that the property  $(\mathfrak{Q}_i)$  holds and we proceed by induction over  $n$ . First let  $r$  be an integer such that  $H^1(F_v, \mathbb{Z}_p(i))^{p^r}$  has no  $\mathbb{Z}_p$ -torsion for all prime  $v$  above  $p$ . By  $(\mathfrak{Q}_i)$  for  $s = r + 1$ , there is an integer  $c_i \geq r$  (see Remark 3.1) such that for all  $x \in H^1(G_S(F), \mathbb{Z}_p(i))$ :

$$(x \in H^1(F_v, \mathbb{Z}_p(i))^{p^{c_i+1}}, \forall v \mid p) \implies x \in H^1(G_S(F), \mathbb{Z}_p(i))^{p^{r+1}}. \tag{13}$$

The case  $n = 1$  is deduced from (13). Let  $n > 1$  and let  $x \in H^1(G_S(F), \mathbb{Z}_p(i))$  such that  $x$  belongs to  $H^1(F_v, \mathbb{Z}_p(i))^{p^{c_i+n}}$  for all  $v$  above  $p$ . According to (13), there is a  $y \in H^1(G_S(F), \mathbb{Z}_p(i))$  such that  $x = y^{p^{r+1}}$ . Since  $(y^{p^r})^p = x \in (H^1(F_v, \mathbb{Z}_p(i))^{p^{c_i+n-1}})^p$ , we obtain that  $y^{p^r} \in H^1(F_v, \mathbb{Z}_p(i))^{p^{c_i+n-1}}$ , by the choice of  $r$ . Hence  $y^{p^r} \in H^1(G_S(F), \mathbb{Z}_p(i))^{p^{n-1}}$ , this implies that

$$x = (y^{p^r})^p \in H^1(G_S(F), \mathbb{Z}_p(i))^{p^n}.$$

The implications (iii)  $\implies$  (ii), (iii)  $\implies$  (iv) and (iv)  $\implies$  (i) are obvious.  $\square$

**Remark 3.5.** **i)** From the proof of Theorem 3.4, we see that the truth of  $(\mathfrak{Q}_i)$  is equivalent to the injectivity of the map  $\alpha^{(i)}$  also in the case where  $i = 0$ . As a consequence of Remark 3.3, the property  $(\mathfrak{Q}_0)$  is always true.  
**ii)** The existence of the constant  $c_i$  is trivial in the case of totally real number field  $F$  and even integer  $i$ , since

$$H^1(G_S(F), \mathbb{Z}_p(i)) = \text{tor}_{\mathbb{Z}_p} H^1(G_S(F), \mathbb{Z}_p(i));$$

in particular, Conjecture  $C^{(1-i)}$  holds for  $(F, p)$ .

**Definition 3.6.** We define the twisted Kummer-Leopoldt constant  $\kappa_i = \kappa_i(F)$  of the field  $F$  to be the minimal integer  $c_i$  satisfying the property (iv) of Theorem 3.4.

The aim now is to determine the exact value of the twisted Kummer-Leopoldt constant. We shall express it as the exponent of a certain Galois module.

**Lemma 3.7.** Let  $i \neq 0, 1$  be an integer such that  $F$  satisfies Conjecture  $C^{(i)}$ . The surjective homomorphism  $\psi : \mathcal{X}_F^{(1-i)} \twoheadrightarrow X'_\infty(i-1)_{G_\infty}$  factors through a homomorphism

$$\Psi : T_F^{(1-i)} \longrightarrow X'_\infty(i-1)_{G_\infty}$$

and  $\ker(\Psi)$  is isomorphic to the Galois group  $\text{Gal}(F^{\text{BP},(1-i)} / \tilde{F}^{(1-i)} L^{(1-i)})$ .

**Proof.** First of all, we recall from the end of the proof of Proposition 2.13 that the image of  $W^{(i)}$  in  $\mathcal{J}_F^{(1-i)}$  is contained in the kernel

$$Y^{(1-i)} := \ker(\psi : \mathcal{X}_F^{(1-i)} \rightarrow X'_\infty(i-1)_{G_\infty}).$$

Therefore, taking the restriction of the surjective homomorphism

$$\psi : \mathcal{X}_F^{(1-i)} \twoheadrightarrow X'_\infty(i-1)_{G_\infty}$$

to  $\mathcal{J}_F^{(1-i)}$ , we obtain the following commutative diagram with exact lines:

$$\begin{array}{ccccccc} 0 & \longrightarrow & W^{(i)} & \longrightarrow & \mathcal{J}_F^{(1-i)} & \longrightarrow & T_F^{(1-i)} \longrightarrow 0 \\ & & \downarrow & & \parallel & & \downarrow \Psi \\ 0 & \longrightarrow & \text{tor}_{\mathbb{Z}_p} Y^{(1-i)} & \longrightarrow & \mathcal{J}_F^{(1-i)} & \longrightarrow & X'_\infty(i-1)_{G_\infty} \end{array}$$

Thus  $\psi$  induces the following homomorphism

$$\Psi : T_F^{(1-i)} \longrightarrow X'_\infty(i-1)_{G_\infty}.$$

Furthermore, reading the figure in page 379, we see that the kernel  $\ker(\Psi)$  is isomorphic to the Galois group  $\text{Gal}(F^{\text{BP},(1-i)} / \tilde{F}^{(1-i)} L^{(1-i)})$ .  $\square$

**Theorem 3.8.** Let  $F$  be a number field and let  $i \neq 0, 1$  be an integer such that  $F$  satisfies Conjecture  $C^{(1-i)}$ . Let  $\kappa_i$  be the twisted Kummer-Leopoldt constant of  $F$ . Then  $p^{\kappa_i}$  is the exponent of the Galois group  $\text{Gal}(F^{\text{BP},(1-i)} / \tilde{F}^{(1-i)} L^{(1-i)})$ .

**Proof.** Let us prove that  $p^{\kappa_i}$  is the exponent of

$$\ker(\Psi) \simeq \text{Gal}(F^{\text{BP},(1-i)} / \tilde{F}^{(1-i)} L^{(1-i)})$$

(Lemma 3.7). Let  $j = 1 - i$  and recall that the kernel

$$Y^{(j)} = \ker(\mathcal{X}_F^{(j)} \rightarrow X'_\infty(-j)_{G_\infty})$$

is equal to the Galois group  $\text{Gal}(\widehat{F}^{(j)}/L^{(j)})$ . For  $n$  sufficiently large such that  $p^n$  kills the  $\mathbb{Z}_p$ -torsion  $\mathcal{T}_F^{(j)}$  of  $\mathcal{X}_F^{(j)}$ , the multiplication by  $p^n$  yields the following exact sequence

$$0 \longrightarrow Y^{(j)}[p^n] \longrightarrow \mathcal{T}_F^{(j)} \longrightarrow X'_\infty(-j)_{G_\infty}.$$

Comparing with the exact sequence of Corollary 2.12, we get a commutative diagram:

$$\begin{array}{ccccccc} 0 & \longrightarrow & W^{(1-j)} & \longrightarrow & \mathcal{T}_F^{(j)} & \longrightarrow & \Gamma_F^{(j)} \longrightarrow 0 \\ & & \downarrow g_n & & \parallel & & \downarrow \Psi \\ 0 & \longrightarrow & Y^{(j)}[p^n] & \longrightarrow & \mathcal{T}_F^{(j)} & \longrightarrow & X'_\infty(-j)_{G_\infty} \end{array}$$

Using the snake lemma, we obtain that

$$\ker(\Psi) \simeq \text{coker}(g_n). \tag{14}$$

Since Conjecture  $C^{(j)}$  holds for  $F$ , the map  $\alpha^{(i)}$  is injective (recall that  $j = 1 - i$ ). Let us consider the following commutative diagram

$$\begin{array}{ccccccc} 0 & \longrightarrow & H^1(G_S(F), \mathbb{Z}_p(i)) & \xrightarrow{\alpha^{(i)}} & \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i)) & \longrightarrow & Y^{(j)} \longrightarrow 0 \\ & & \downarrow p^n & & \downarrow p^n & & \downarrow p^n \\ 0 & \longrightarrow & H^1(G_S(F), \mathbb{Z}_p(i)) & \xrightarrow{\alpha^{(i)}} & \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i)) & \longrightarrow & Y^{(j)} \longrightarrow 0. \end{array}$$

By the snake lemma, we obtain the following exact sequence

$$\begin{array}{c} 0 \longrightarrow H^1(G_S(F), \mathbb{Z}_p(i))[p^n] \longrightarrow \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i))[p^n] \xrightarrow{\phi_n} Y^{(j)}[p^n] \longrightarrow \dots \\ \phantom{0 \longrightarrow} \searrow \hspace{10em} \swarrow \\ \phantom{0 \longrightarrow} \longrightarrow H^1(G_S(F), \mathbb{Z}_p(i))/p^n \xrightarrow{\alpha_n^{(i)}} \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i))/p^n \longrightarrow \dots \end{array}$$

It follows that  $\text{coker}(\phi_n)$  is isomorphic to the kernel  $\ker(\alpha_n^{(i)})$ . Notice that for  $n$  large enough,

$$H^1(G_S(F), \mathbb{Z}_p(i))[p^n] \simeq H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i))$$

and

$$H^1(F_v, \mathbb{Z}_p(i))[p^n] \simeq H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(i))$$

for all  $v$  over  $p$ . Hence, we get that  $\text{coker}(\phi_n)$  is isomorphic to  $\text{coker}(g_n)$ . Then, by (14)

$$\begin{aligned} \text{coker}(g_n) &\simeq \ker(\alpha_n^{(i)}) \\ &\simeq \ker(\Psi). \end{aligned}$$

Since  $p^{k_i}$  is the exponent of  $\ker \alpha_n^{(i)}$ , for  $n$  large enough, the result follows from Lemma 3.7. □

We finish this section with the following proposition in which we consider the case of a CM-field.

**Proposition 3.9.** *Let  $F$  be a CM-field with totally real subfield  $F^+$  and let  $i$  be an odd integer. Assume that the field  $F^+$  satisfies Conjecture  $C^{(1-i)}$ . Then the twisted Kummer-Leopoldt constants  $\kappa_i := \kappa_i(F)$  and  $\kappa_i^+ := \kappa_i(F^+)$  are equal.*

**Proof.** Let  $n$  be an integer such that  $p^n$  kills both  $\bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(i))$  and  $\mathcal{J}_F^{(1-i)}$ . According to the end of the proof of Theorem 3.8, we know that  $p^{\kappa_i}$  is the exponent of

$$\ker(\alpha_n^{(i)} : H^1(G_S(F), \mathbb{Z}_p(i))/p^n \rightarrow \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i))/p^n).$$

Let  $\tau \in \text{Gal}(F/F^+)$  be the complex conjugation. Consider the decomposition

$$\ker(\alpha_n^{(i)}) = (\ker(\alpha_n^{(i)}))^+ \oplus (\ker(\alpha_n^{(i)}))^-,$$

where  $(\ker(\alpha_n^{(i)}))^{\pm} = (1 \pm \tau) \ker(\alpha_n^{(i)})$ . We have to show that  $(\ker(\alpha_n^{(i)}))^-$  is trivial and that the exponent of  $(\ker(\alpha_n^{(i)}))^+$  is  $p^{\kappa_i^+}$ . We start by observing that

$$H^1(G_S(F), \mathbb{Z}_p(i))^+ \simeq H^1(G_S(F^+), \mathbb{Z}_p(i)).$$

Since

$$\text{rank}_{\mathbb{Z}_p} H^1(G_S(F), \mathbb{Z}_p(i)) = \text{rank}_{\mathbb{Z}_p} H^1(G_S(F^+), \mathbb{Z}_p(i)),$$

it follows that  $H^1(G_S(F), \mathbb{Z}_p(i))^-$  is a  $\mathbb{Z}_p$ -torsion module. Furthermore, notice that

$$H^0(G_S(F^+), \mathbb{Q}_p/\mathbb{Z}_p(i)) = 0 \iff i \not\equiv 0 \pmod{[F^+(\mu_p) : F^+]}.$$

Since  $[F^+(\mu_p) : F^+]$  is even and  $i$  is odd, we get that  $H^0(G_S(F^+), \mathbb{Q}_p/\mathbb{Z}_p(i))$  is trivial. This implies that

$$H^1(G_S(F), \mathbb{Z}_p(i))^- = \text{tor}_{\mathbb{Z}_p} H^1(G_S(F), \mathbb{Z}_p(i)).$$

Using this fact and the choice of  $n$ , we see that the map

$$(\alpha_n^{(i)})^- : (H^1(G_S(F), \mathbb{Z}_p(i))/p^n)^- \rightarrow (\bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i))/p^n)^-$$

is nothing but the injection

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(i)) \rightarrow (\bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i))/p^n)^-.$$

Therefore,  $(\ker(\alpha_n^{(i)}))^-$  is trivial for  $n$  large enough.

Also, using the isomorphism

$$(H^1(G_S(F), \mathbb{Z}_p(i))/p^n)^+ \simeq H^1(G_S(F^+), \mathbb{Z}_p(i))/p^n$$

we get that  $(\ker(\alpha_n^{(i)}))^+$  is the kernel of the map

$$H^1(G_S(F^+), \mathbb{Z}_p(i))/p^n \rightarrow (\bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(i))/p^n)^+$$

which is of exponent  $p^{\kappa_i^+}$ . □

#### 4. On the triviality of the twisted Kummer-Leopoldt constant

Let  $i$  be an integer and let  $p$  be an odd prime number. The  $(p, i)$ -regular number fields have been introduced in [2, Definition 1.1] as a generalization of  $p$ -rational fields [20, 21, 22]. Recall that a number field  $F$  is  $(p, i)$ -regular if the cohomology group  $H^2(G_S(F), \mathbb{Z}/p\mathbb{Z}(i))$  is trivial, or equivalently if  $F$  satisfies Conjecture  $C^{(i)}$  and the  $\mathbb{Z}_p$ -module  $\mathcal{J}_F^{(i)}$  is trivial. In particular, this triviality implies that of  $\text{Gal}(\mathbb{F}^{\text{BP},(i)}/\tilde{F}^{(i)}L^{(i)})$ , where  $\tilde{F}^{(i)}$  is the subfield of  $\hat{F}^{(i)}$  fixed by  $\mathcal{J}_F^{(i)}$  (Definition 2.5). Hence, by Theorem 3.8, we see that  $\kappa_{1-i}$  is trivial for  $(p, i)$ -regular number fields. In this section, we consider the other implication. Precisely, we give a characterization of the  $(p, i)$ -regularity in terms of the triviality of  $\kappa_{1-i}$ .

**Theorem 4.1.** *Let  $i \neq 0, 1$  be an integer and let  $F$  be a number field satisfying Conjecture  $C^{(i)}$ . Then  $F$  is  $(p, i)$ -regular if and only if the following three conditions hold:*

- 1)  $\kappa_{1-i} = 0$ ;
- 2) The injective map

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \longrightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$$

- is an isomorphism;
- 3)  $H^{(i)} \subset \tilde{F}^{(i)}$ .

**Proof.** Let us recall that  $p^{\kappa_{1-i}}$  is the exponent of  $\text{Gal}(\mathbb{F}^{\text{BP},(i)}/\tilde{F}^{(i)}L^{(i)})$  by Theorem 3.8 and that  $\text{Gal}(\mathbb{F}^{\text{BP},(i)}/\tilde{F}^{(i)}L^{(i)}) \simeq \ker(\Psi : \mathbb{T}_F^{(i)} \longrightarrow X'_\infty(-i))$  by Lemma 3.7.

Suppose that  $F$  is  $(p, i)$ -regular. Then, the  $\mathbb{Z}_p$ -torsion module  $\mathcal{J}_F^{(i)}$  is trivial. Using the exact sequence (8) of Corollary 2.12, we get that the groups  $W^{(1-i)}$  and  $\mathbb{T}_F^{(i)}$  are both trivial. Therefore, we obtain Condition 2) from the triviality of  $W^{(1-i)}$ , and Condition 1) from the triviality of  $\mathbb{T}_F^{(i)}$ . Furthermore, the vanishing of  $\mathcal{J}_F^{(i)}$  shows that  $\hat{F}^{(i)} = \tilde{F}^{(i)}$ . Since  $L^{(i)}$  is contained in  $\hat{F}^{(i)}$ , we have  $L^{(i)} \subset \tilde{F}^{(i)}$ . This proves that  $H^{(i)} \subset \tilde{F}^{(i)}$ .

Now assume that the three conditions are satisfied. Using again the exact sequence (8) of Corollary 2.12 we see that  $\mathcal{J}_F^{(i)}$  and  $\mathbb{T}_F^{(i)}$  are isomorphic, since  $W^{(1-i)}$  is trivial by Condition 2). Further, using Remark 2.10 with Condition 3) we obtain that the field  $L^{(i)}$  is contained in  $\tilde{F}^{(i)}$ . Hence the morphism  $\Psi : \mathbb{T}_F^{(i)} \longrightarrow X'_\infty(-i)$  is trivial. In particular, the kernel of  $\Psi$  equals to  $\mathbb{T}_F^{(i)}$ . Therefore, by Theorem 3.8, the Bertrandias-Payan module  $\mathbb{T}_F^{(i)}$  is trivial because of the nullity of  $\kappa_{1-i}$ . Hence the number field  $F$  is  $(p, i)$ -regular.  $\square$

**Remark 4.2** (compare with [8, Proposition 2.3]). *For the case  $i = 0$ , using the same arguments in the proof of Theorem 4.1, we can show that  $F$  is  $p$ -rational exactly when the three conditions hold:*

- 1)  $\kappa(F) = 0$ ;

- 2) The map  $\mu_p(F) \longrightarrow \bigoplus_{v|p} \mu_p(F_v)$  is an isomorphism;
- 3)  $H_F \subset \tilde{F}$ .

Here  $\kappa(F)$  is the Kummer-Leopoldt constant for the units [7, Definition 1],  $H_F$  is the Hilbert class field of  $F$  and  $\tilde{F}$  is the composite of all  $\mathbb{Z}_p$ -extensions of  $F$ .

It is well known that the field of rational numbers  $\mathbb{Q}$  is  $p$ -rational for any prime number  $p$ . This is not the case for the  $(p, i)$ -regularity. For example, if the prime  $p$  is irregular, there is at least an integer  $i$  for which  $\mathbb{Q}$  is not  $(p, i)$ -regular (a consequence of [2, (ii,  $\beta$ ) Proposition 1.3]). It is also well known that all subfields of a  $(p, i)$ -regular number field are  $(p, i)$ -regular. Thus, to study the  $(p, i)$ -regularity of number fields we must suppose that  $\mathbb{Q}$  is  $(p, i)$ -regular. From now on, we assume that  $\mathbb{Q}$  is  $(p, i)$ -regular and we consider the case of quadratic number fields. The aim is to give a characterization of the  $(p, i)$ -regularity of a quadratic number field in the spirit of [12, §4.1].

We start with the following consequence of Theorem 4.1 and Proposition 3.9 that shows the triviality of some twisted Kummer-Leopoldt constants for imaginary quadratic fields.

**Corollary 4.3.** *Let  $p$  be an odd prime number and let  $i$  be an even integer such that  $\mathbb{Q}$  is  $(p, i)$ -regular. Then, the Kummer-Leopoldt constant  $\kappa_{1-i}(F)$  is zero for any imaginary quadratic field  $F$ .  $\square$*

Now, we prove the following helpful lemma in which we show that the morphism

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \longrightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$$

is almost always an isomorphism.

**Lemma 4.4.** *Let  $F = \mathbb{Q}(\sqrt{d})$  be a quadratic number field and let  $i$  be an integer. Then, the map  $H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \longrightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$  is an isomorphism exactly in the following situations:*

- i) the prime  $p$  splits in  $F/\mathbb{Q}$  and  $i \not\equiv 1 \pmod{p-1}$ ;
- ii) the prime  $p$  is inert in  $F/\mathbb{Q}$ ;
- iii) the prime  $p$  ramifies in  $F/\mathbb{Q}$  and  $\frac{2(i-1)}{p-1}$  is even if  $i \equiv 1 \pmod{\frac{p-1}{2}}$  and  $(-1)^{\frac{p-1}{2}} \frac{d}{p}$  is a square in  $\mathbb{Q}_p$ .

**Proof.** We start with the following well known isomorphisms

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \simeq \mathbb{Z}/p^{w_i}\mathbb{Z} \text{ and } H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \simeq \mathbb{Z}/p^{w_{v,i}}\mathbb{Z},$$

where

$$w_i := \max\{n \mid i \equiv 1 \pmod{[F(\mu_{p^n}) : F]}\}$$

and

$$w_{v,i} := \max\{n \mid i \equiv 1 \pmod{[F_v(\mu_{p^n}) : F_v]}\}.$$

To prove the lemma, we discuss on the ramification of the prime  $p$  in  $F/\mathbb{Q}$ . We start with the case where  $p$  splits in  $F/\mathbb{Q}$ . Let  $v$  and  $v'$  be the primes of  $F$  above  $p$ . Observe that for all  $n \geq 1$ , we have

$$[F(\mu_{p^n}) : F] = [F_v(\mu_{p^n}) : F_v] = [F_{v'}(\mu_{p^n}) : F_{v'}] = p^{n-1}(p-1).$$

Hence,  $H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$  is an isomorphism

if and only if the groups  $H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i))$ ,  $H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$  and  $H^0(F_{v'}, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$  are trivial. This is equivalent to  $i \not\equiv 1 \pmod{p-1}$ .

Suppose now that  $p$  is inert in  $F/\mathbb{Q}$  and let  $v$  be the unique prime of  $F$  above  $p$ .

Since  $F \cap \mathbb{Q}(\mu_p) = \mathbb{Q}$  and  $F_v \cap \mathbb{Q}_p(\mu_p) = \mathbb{Q}_p$ , we have

$$[F(\mu_{p^n}) : F] = [F_v(\mu_{p^n}) : F_v] = p^{n-1}(p-1) \quad \text{for all } n \geq 1.$$

Thus the map  $H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$  is always an isomorphism.

The remainder case is when  $p$  ramifies in  $F/\mathbb{Q}$ . Let  $v$  be the unique prime of  $F$  above  $p$ . Suppose further that  $d \neq (-1)^{\frac{p-1}{2}} p$  and  $(-1)^{\frac{p-1}{2}} \frac{d}{p}$  is a square in  $\mathbb{Q}_p$ . On

the one hand, since  $\mathbb{Q}(\sqrt{(-1)^{\frac{p-1}{2}} p})$  is the unique quadratic subfield of  $\mathbb{Q}(\mu_p)$ , we can see that  $F \cap \mathbb{Q}(\mu_p) = \mathbb{Q}$ . On the other hand, the condition  $(-1)^{\frac{p-1}{2}} \frac{d}{p}$  is a square in  $\mathbb{Q}_p$  means that  $F_v \cap \mathbb{Q}_p(\mu_p) = F_v$ . Therefore for all  $n \geq 1$ , we have

$$[F(\mu_{p^n}) : F] = p^{n-1}(p-1) \text{ and } [F_v(\mu_{p^n}) : F_v] = p^{n-1} \frac{(p-1)}{2}.$$

Comparing the integers  $w_i$  and  $w_{v,i}$ , we get that  $w_i = w_{v,i}$  if and only if either  $i \not\equiv 1 \pmod{\frac{p-1}{2}}$  or  $i \equiv 1 \pmod{\frac{p-1}{2}}$  and  $\frac{2(i-1)}{p-1}$  is even.

To finish the proof we have to show that

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$$

is an isomorphism when either  $d = (-1)^{\frac{p-1}{2}} p$  or  $d \neq (-1)^{\frac{p-1}{2}} p$  and  $(-1)^{\frac{p-1}{2}} \frac{d}{p}$  is not a square in  $\mathbb{Q}_p$ . This is deduced from the fact that in both cases we have

$$[F(\mu_{p^n}) : F] = [F_v(\mu_{p^n}) : F_v] \quad \text{for all } n \geq 1.$$

□

**Remark 4.5.** *a) When the integer  $i$  satisfies  $i \not\equiv 1 \pmod{\frac{p-1}{2}}$ , the localization map*

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$$

*is always an isomorphism.*

**b)** *If the integer  $i$  is even, then*

$$H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(1-i)) \rightarrow \bigoplus_{v|p} H^0(F_v, \mathbb{Q}_p/\mathbb{Z}_p(1-i))$$

*is not an isomorphism exactly when  $p$  ramifies in  $F/\mathbb{Q}$  and the following two conditions hold:*

- $p \equiv 3 \pmod{4}$ ,  $d \neq -p$  and  $\frac{-d}{p}$  is a square in  $\mathbb{Q}_p$ ;
- $i \equiv 1 \pmod{\frac{p-1}{2}}$  and  $\frac{2(i-1)}{p-1}$  is odd.

According to Corollary 4.3 and ii) of Remark 3.5, we see that the twisted Kummer-Leopoldt constant  $\kappa_{1-i}(F)$  is always zero when  $F$  is an imaginary quadratic field and  $i$  is even or  $F$  is a real quadratic field and  $i$  is odd. Using Theorem 4.1 and Lemma 4.4, we get the following characterizations of the  $(p, i)$ -regularity for quadratic fields.

**Proposition 4.6.** *Let  $i \geq 2$  be an integer such that  $\mathbb{Q}$  is  $(p, i)$ -regular. For a square free integer  $d > 0$ , let  $F = \mathbb{Q}(\sqrt{(-1)^{i+1}d})$ . Suppose that  $F$  satisfies one of the three conditions in Lemma 4.4. Then,  $F$  is  $(p, i)$ -regular if and only if  $H^{(i)}$  is contained in  $\tilde{F}^{(i)}$ . In particular,  $F$  is  $(p, i)$ -regular when  $X'_\infty(-i)_{G_\infty}$  is trivial.  $\square$*

Proposition 4.6 concerns only the cases when  $F$  is an imaginary quadratic field and  $i$  is even or  $F$  is a real quadratic field and  $i$  is odd. In the other cases, we have the following characterization.

**Proposition 4.7.** *Let  $i \geq 2$  be an integer such that  $\mathbb{Q}$  is  $(p, i)$ -regular. For a square free integer  $d > 0$ , let  $F = \mathbb{Q}(\sqrt{(-1)^i d})$ . Suppose that  $F$  satisfies one of the three conditions in Lemma 4.4. Then the quadratic field  $F$  is  $(p, i)$ -regular exactly when the following conditions hold:*

- a)** *The map  $H^1(G_S(F), \mathbb{Z}_p(1-i))/p \rightarrow \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(1-i))/p$  is injective.*
- b)** *The field  $H^{(i)}$  is contained in  $\tilde{F}^{(i)}$ .*

**Proof.** Let  $j = 1 - i$ . For simplicity we suppose that  $H^0(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(j)) = 0$ . Following Theorem 4.1 and Lemma 4.4, we have to prove the equivalence between the triviality of  $\kappa_j$  and the injectivity of the map

$$\alpha_1^{(j)} : H^1(G_S(F), \mathbb{Z}_p(j))/p \rightarrow \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(j))/p.$$

Recall that  $\kappa_j$  is trivial precisely when

$$\alpha_n^{(j)} : H^1(G_S(F), \mathbb{Q}_p/\mathbb{Z}_p(j))/p^n \rightarrow \bigoplus_{v|p} H^1(F_v, \mathbb{Q}_p/\mathbb{Z}_p(j))/p^n$$

is injective for  $n$  large. Let's consider the commutative diagram:

$$\begin{array}{ccccc} 0 \rightarrow & (H^1(G_S(F), \mathbb{Z}_p(j)))^p & \rightarrow & H^1(G_S(F), \mathbb{Z}_p(j)) & \rightarrow & H^1(G_S(F), \mathbb{Z}_p(j))/p \rightarrow 0 \\ & \downarrow p^{n-1} & & \downarrow p^{n-1} & & \downarrow \\ 0 \rightarrow & (H^1(G_S(F), \mathbb{Z}_p(j)))^{p^n} & \rightarrow & H^1(G_S(F), \mathbb{Z}_p(j)) & \rightarrow & H^1(G_S(F), \mathbb{Z}_p(j))/p^n \rightarrow 0 \end{array}$$

where the right vertical map is defined by

$$x \pmod{H^1(G_S(F), \mathbb{Z}_p(j))^p} \mapsto x^{p^{n-1}} \pmod{H^1(G_S(F), \mathbb{Z}_p(j))^{p^n}}$$

and is clearly injective. Hence we have

$$H^1(G_S(F), \mathbb{Z}_p(j))/p^{n-1} \simeq \text{coker}(H^1(G_S(F), \mathbb{Z}_p(j))/p \hookrightarrow H^1(G_S(F), \mathbb{Z}_p(j))/p^n).$$

Likewise, we see that for every  $p$ -adic place  $v$

$$H^1(F_v, \mathbb{Z}_p(j))/p^{n-1} \simeq \text{coker}(H^1(F_v, \mathbb{Z}_p(j))/p \hookrightarrow H^1(F_v, \mathbb{Z}_p(j))/p^n).$$

Therefore, the commutative diagram

$$\begin{array}{ccccccc} 0 \rightarrow & \ker(\alpha_1^{(j)}) & \rightarrow & H^1(G_S(F), \mathbb{Z}_p(j))/p & \xrightarrow{\alpha_1^{(j)}} & \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(j))/p \\ & \downarrow & & \downarrow & & \\ 0 \rightarrow & \ker(\alpha_n^{(j)}) & \rightarrow & H^1(G_S(F), \mathbb{Z}_p(j))/p^n & \xrightarrow{\alpha_n^{(j)}} & \bigoplus_{v|p} H^1(F_v, \mathbb{Z}_p(j))/p^n \end{array}$$

and the snake lemma induce the following exact sequence:

$$0 \longrightarrow \ker(\alpha_1^{(j)}) \longrightarrow \ker(\alpha_n^{(j)}) \longrightarrow \ker(\alpha_{n-1}^{(j)}) \longrightarrow 0. \tag{15}$$

An inductive process and the exact sequence (15) show that  $\ker(\alpha_n^{(j)})$  is trivial for all  $n \geq 2$  when  $\ker(\alpha_1^{(j)})$  is. This means that  $\kappa_j = 0$  when  $\ker(\alpha_1^{(j)})$  is trivial. Conversely, if  $\kappa_j = 0$ , the exact sequence (15) shows that  $\ker(\alpha_1^{(j)})$  is trivial.  $\square$

The main results of this section can be compared with [8, Proposition 2.3] and [12, Proposition 4.1]. In fact, Condition a) in the above proposition can be interpreted using Kummer theory. Indeed, it is well known that there is a subgroup  $D_F^{(1-i)}$  of  $E^\bullet := E \setminus \{0\}$ ,  $E = F(\mu_p)$ , such that

$$H^1(G_S(F), \mathbb{Z}_p(1-i))/p \cong D_F^{(1-i)}/E^{\bullet p}(-i)$$

and, for each prime  $v$  of  $F$  above  $p$ , a subgroup  $D_v^{(1-i)}$  of  $E_w^\bullet$ ,  $w$  being a prime of  $E$  above  $v$ , such that

$$H^1(F_v, \mathbb{Z}_p(1-i))/p \cong D_v^{(1-i)}/E_w^{\bullet p}(-i),$$

[10, 5, 6]. So, Condition a) asserts that the natural map

$$D_F^{(1-i)}/E^{\cdot p} \longrightarrow \bigoplus_{v|p} D_v^{(1-i)}/E_w^{\cdot p},$$

where for each  $v$  above  $p$ ,  $w$  is a place of  $E$  dividing  $v$ , is injective.

**Example.** The quadratic number field  $F = \mathbb{Q}(\sqrt{\pm p})$  is  $(p, i)$ -regular for every integer  $i \equiv 1 \pmod{p-1}$ . In fact, note that  $F$  has a unique  $p$ -adic prime and its class number is less than  $p$  e.g., [8, page 14]. Hence according to [2, (ii,  $\alpha$ ), Proposition 1.3],  $F$  is  $(p, i)$ -regular. Then the quadratic number field  $F$  satisfies Conjecture  $C^{(i)}$  and  $\kappa_{1-i} = 0$  for all  $i \equiv 1 \pmod{p-1}$ .
